

Product Requirements Document (PRD)

Project Title

Shubh Labh CRM Operations Integration PRD

Document Purpose

This PRD defines the complete operational integration required inside Shubh Labh CRM to reduce manual dependency, prevent missed follow-ups and dispatch errors, improve payment collection tracking, standardize customer communication, and give admin full daily visibility of staff work. The current CRM already contains Today, Customers, Data & Sync, Requirements, Follow-ups, Activity, and Settings sections, along with overdue and action-needed indicators, so the new modules should extend this existing workflow rather than create a separate system.

[cite:35]

Product Vision

Build a simple, structured, low-typing CRM workflow in which every customer call, payment reminder, lead update, dormant-customer call, raw-material requirement, packaging requirement, dispatch action, and WhatsApp communication is recorded with staff name, timestamp, status, and next action. The system should be simple enough for less-educated staff to use through dropdowns, buttons, and fixed options, while giving admin a real-time control tower for daily operations.[cite:35]

Problem Statement

The current business process is heavily manual. Staff members inform admin manually, operational lists are shared separately, customer updates are not standardized, and important business details can be missed during order handling and dispatch. The CRM currently shows existing operational areas such as follow-ups, requirements, activity, overdue actions, and dormant accounts, but these areas are not yet fully structured into a controlled daily process.

[cite:35]

The business is facing several operational failures:

- Payment-due customers are not handled through a strict, system-generated daily call queue.
- Customer responses are entered inconsistently in free text.
- New leads and dormant customers are not managed through a fixed follow-up workflow.
- Dispatch, production, raw material, and packaging-material lists are still manual.
- Special customer instructions, gifts, samples, bag requirements, and dispatch notes can be missed.

- Customer communication is not fully tracked through business WhatsApp with delivery logs.
- Admin does not receive one complete daily summary of all staff actions.

Objectives

- Standardize all daily operational work inside CRM.
- Replace free-text-heavy data entry with dropdown-driven workflows.
- Ensure every call and operational update produces a next action.
- Create admin-level daily visibility for all staff work.
- Integrate WhatsApp communication with time-stamped logs and delivery status tracking.
- Generate monthly customer outstanding statements and maintain send history.
- Prevent dispatch errors caused by missing instructions, packing details, or communication failures.

Scope

In Scope

- Payment follow-up call management
- New lead management
- Dormant-customer reactivation workflow
- Daily dispatch list workflow
- Daily production list workflow
- Daily raw-material requirement list
- Daily packaging and material-bag requirement list
- Order note and special-instruction checklist
- Transport booking workflow
- WhatsApp communication logging and status tracking
- Monthly outstanding statement generation and sending
- Admin dashboards, summaries, and staff visibility
- Structured activity logs and dropdown-based response capture

Out of Scope (Initial Release)

- Full accounting/ERP replacement
- Advanced inventory forecasting
- AI-based call transcription
- Multi-branch warehouse optimization

- Full telephony integration

User Roles

Admin / Owner

- Reviews daily lists
- Approves dispatch and production decisions
- Monitors staff work
- Reviews payment progress, dormant-customer status, and lead pipeline
- Receives daily operational summaries
- Escalates special customer issues

Calling Staff

- Handles payment follow-up calls
- Calls new leads
- Calls dormant customers
- Updates structured call outcomes
- Sets next follow-up date
- Sends approved WhatsApp reminders where applicable

Operations Staff

- Prepares dispatch list
- Prepares production list
- Submits raw-material and packaging-material requirements
- Books transport
- Updates dispatch confirmation
- Sends dispatch details to customers via CRM workflow

Senior Staff / Supervisor

- Handles escalated customer cases
- Resolves account disputes, service complaints, and special communication requests
- Verifies important dispatch or packing exceptions

Core Product Principles

- No dispatch without completed checklist.
- No important customer update without CRM entry.
- No follow-up closure without next action or outcome.
- No business communication outside trackable workflow where tracking is required.
- One structured system for daily calls, dispatch, production, materials, and customer messaging.
- Minimal typing; maximum guided selection.

Functional Requirements

1. Payment Follow-up Module

Create a daily payment call queue from customers whose due date has arrived or whose follow-up date is due. Staff should work from this queue instead of manually choosing customers.

Requirements

- Auto-generate Today's Payment Call List.
- Show customer name, due amount, due date, last update, and assigned staff.
- Staff must select a structured outcome after each call.
- Staff must choose next action and next follow-up date where applicable.
- Admin should receive staff-wise and total payment call summary at day end.

Structured Response Design

The update form should use a category + refined option + next action pattern.

Main Categories

- Payment commitment
- Customer unavailable
- Customer issue
- Statement/account request
- Escalation needed
- Follow-up later

Example Refined Options

- Sending payment today
- Payment within 2 days
- Payment within 3 to 5 days
- Payment next week
- Payment next month
- Part payment today
- Not picking phone
- Phone not reachable
- Call later
- Customer asking for statement
- Customer asking for ledger
- Wants to talk to senior staff
- Wants to talk to owner
- Cash problem
- Market down
- Payment stuck in market

Auto Behaviors

- Auto-create follow-up task from selected response.
- Auto-create escalation task for senior/admin when required.
- Auto-create statement task if customer requests statement.
- Reopen payment task if no update is saved.

2. New Lead Management Module

A daily new-lead queue should be created so staff can call and update new prospects in a structured way.

Requirements

- Daily New Lead Call Queue.
- Lead status options such as Interested, Not Interested, Call Later, Need Rate List, Need Sample, Need Visit.
- Mandatory next follow-up date for warm leads.
- Admin summary for leads called today.
- Assignable owner/staff responsibility.

3. Dormant Customer Revival Module

Customers who have stopped buying should move into an inactivity-based queue, such as 30, 60, or 90 days without purchase, so they can be contacted through a structured revival process. The current CRM already surfaces dormant accounts, which makes this a natural extension of existing functionality.[cite:35]

Requirements

- Auto-identify dormant customers by inactivity age.
- Prioritize high-value dormant customers first.
- Staff must capture revival outcome.
- Capture reasons like price issue, competitor shift, product issue, market down, not reachable, wants visit.
- Generate next follow-up task if revival remains possible.
- Give admin a daily dormant-customer report.

4. Order Note and Special Instruction Module

Every order should carry a compulsory checklist so no critical customer requirement gets missed.

Mandatory Fields

- Customer name
- Brand
- Product and quantity
- Dispatch required date
- Special customer request
- Owner instruction
- Gift item yes/no
- Sample/free item yes/no
- Bag type and quantity
- Production required yes/no
- Raw material required yes/no
- Packaging material required yes/no
- Dispatch approval status

Rules

- Order cannot move to dispatch-ready without mandatory fields.
- Special instructions should remain highlighted until verified.
- Gift and sample items should be separately visible in packing checklist.
- Owner instructions should have strong visual emphasis.

5. Daily Dispatch Workflow

Dispatch activities should move from manual communication to an approved CRM workflow.

Requirements

- Daily dispatch list generation.
- Admin approval step.
- Dispatch list should be customer-wise and brand-wise.
- Dispatch should link to order checklist.
- Dispatch ready state allowed only after verification.
- Loading and dispatch completion should be time-stamped.

6. Production Workflow

Production planning should be generated from confirmed orders and dispatch needs.

Requirements

- Daily production list by brand.
- Product-wise quantities.
- Required-by date.
- Status such as pending, in production, ready.
- Link each production requirement to orders and dispatch plans.

7. Raw Material Requirement Workflow

Raw-material needs should be captured daily in CRM, not shared manually.

Requirements

- Daily raw-material requirement screen.
- Material name, quantity, unit, linked brand/order.
- Status such as required, available, shortage, ordered, received.
- Admin visibility for shortages.

8. Packaging and Material Bag Workflow

Packaging materials and bags should be captured as part of the daily operational cycle.

Requirements

- Daily packaging-material list.
- Daily bag requirement list.
- Bag type, print type, quantity, linked customer/order.
- Shortage flag.
- Verification before packing complete.

9. Transport Booking and Customer Intimation

Once dispatch is approved, staff should record transport details and customer communication through CRM.

Requirements

- Record transporter name.
- Record vehicle number.
- Record LR/bilty number.
- Record freight and booking time.
- Mark customer informed status.
- Link customer intimation to WhatsApp/send logs.

10. WhatsApp Communication Integration

Business communication such as dispatch details, transport details, payment reminders, and monthly statements should move into a tracked WhatsApp workflow. WhatsApp Business Platform supports status updates through webhooks for business-sent messages, and its template system supports business-initiated template messages.[cite:2][cite:12]

Message Types

- Dispatch confirmation
- Transport booking details
- Payment reminder
- Statement shared
- Lead acknowledgement if required

Requirements

- Send from business WhatsApp account.
- Save message ID.
- Save sent timestamp.
- Save delivered, read, or failed status where available.
- Save sending staff name.
- Save linked customer, order, payment follow-up, or statement record.
- Store reply in communication timeline when supported by workflow.

WhatsApp utility messaging supports order updates and account-related notifications, making it relevant for dispatch and operational reminders.[cite:20][cite:22]

11. Monthly Statement Module

Customers should receive monthly outstanding statements so they remain aware of total pending balance.

Requirements

- Generate monthly customer statement.
- Include opening balance, billing, receipts, adjustments, closing outstanding, overdue invoices.
- Send via WhatsApp through CRM.
- Save send history and delivery log.
- Mark statement request and completion status.

12. Admin Daily Control Dashboard

Admin should have one control center for all important daily work. The current CRM already includes a Today page with action-needed and overdue indicators, which can serve as the foundation for this dashboard.[cite:35]

Dashboard Widgets

- Payment calls due today
- Payment calls completed today
- Promise-to-pay today
- Customers not reachable
- Statement requests pending
- New leads called today
- Dormant customers called today
- Dispatches awaiting approval

- Dispatches completed today
- Production pending
- Raw material shortages
- Packaging and bag shortages
- WhatsApp failed messages
- Staff-wise task completion

Reports

- Daily payment report
- Daily lead report
- Daily dormant-customer report
- Daily dispatch report
- Daily production report
- Daily raw-material report
- Daily packaging and bag report
- Daily WhatsApp communication report
- End-of-day staff summary report

Non-Functional Requirements

- Very simple UI with large buttons and dropdowns
- Hindi/Hinglish-friendly labels
- Minimal typing
- Mobile-friendly for basic staff use
- Fast daily operation flow
- Role-based permissions
- Full activity audit trail
- Retry-safe logging for integrations
- Error visibility for failed tasks and failed messages

UX Requirements

- Keep one screen per task type where possible.
- Use red/yellow/green status colors.
- Use mandatory dropdowns before notes.
- Keep note fields optional and short.
- Show generated update preview before save.
- Show today's pending items first.

- Use simple staff-facing terms rather than formal CRM language.

Example Structured Update Pattern

Payment Call Update

- Category: Payment commitment
- Response: Payment next week
- Next action: Follow up Monday
- Optional note: Shop owner out of station

Generated update preview:

Payment commitment - Payment next week - Follow up Monday

Dormant Customer Update

- Category: Revival possible
- Response: Wants rate list
- Next action: Send price list and call in 2 days

Lead Update

- Category: Interested
- Response: Needs sample
- Next action: Assign sample follow-up

Data Model Overview

The following key entities should be introduced or extended:

- Customer
- Staff assignment
- Payment follow-up task
- Lead task
- Dormant revival task
- Order card
- Dispatch record
- Production record
- Raw material requirement
- Packaging requirement
- Bag requirement
- Transport booking

- WhatsApp message log
- Monthly statement record
- Activity timeline item
- Escalation task

Key Success Metrics

- Percentage of due payment customers called daily
- Percentage of calls with structured response saved
- Reduction in missed follow-up tasks
- Reduction in dispatch errors caused by missed instructions
- Percentage of dispatches with customer intimation logged
- Percentage of monthly statements sent on time
- Reduction in untracked staff communication
- Increase in dormant-customer reactivation attempts
- Increase in lead follow-up completion rate

Risks and Mitigations

Risk	Impact	Mitigation
Staff find system difficult	Low adoption	Use dropdowns, Hinglish labels, training with examples
Too much typing	Incomplete updates	Keep structured options and auto-generated notes
WhatsApp failures	Customer uninformed	Log failed status, retry queue, alert admin
Poor assignment hygiene	Wrong queues	Mandatory customer owner/staff assignment
Missing data at order time	Dispatch errors	Mandatory order checklist before dispatch
Excessive admin effort	Process fatigue	Build automated daily summaries and exception views

Delivery Phases

Phase 1

- Payment follow-up workflow
- Structured call updates
- Admin daily payment summary

Phase 2

- New lead workflow
- Dormant-customer workflow
- Daily admin lead/dormant summary

Phase 3

- Order checklist
- Dispatch workflow
- Production workflow
- Raw material and packaging workflow
- Bag requirement workflow

Phase 4

- WhatsApp integration
- Transport booking logging
- Customer intimation tracking

Phase 5

- Monthly statement generation and sending
- Admin control dashboard and reports

Acceptance Criteria

- Every payment-due customer appears in a structured queue.
- Every completed call has category, response, and next action.
- Every new lead and dormant-customer interaction is logged with next step.
- No dispatch can complete without mandatory checklist verification.
- Raw material, packaging, and bag requirements are submitted daily through CRM.
- Dispatch customer communication is visible in logs.
- WhatsApp messages are linked to customers and business records with status tracking where available.[cite:2][cite:12]
- Monthly statements are generated, sent, and auditable.
- Admin can view a full daily operational summary.

Final Product Outcome

At the end of this integration, Shubh Labh CRM should become a complete daily operations control system. Instead of staff verbally reporting work and managing key tasks manually, the CRM should drive the day through generated queues, structured updates, checklist validation, tracked customer communication, and admin-level visibility across payments, leads, dormant customers, dispatch, production, raw materials, packaging, bags, and statements.[cite:35]
